

# Network-Switching Time — Team (6 GHz) <-> Shared (5 GHz)

Intel AX210 on ROCK 5A, wpa\_supplicant `select\_network`, control over wired eth0

Summary (n = 5+5 trials)

-> 6 GHz team: mean 481 ms (min 352, max 636)

-> 5 GHz shared: mean 326 ms (min 236, max 457)

First data (ping) follows association by ~10-20 ms (same /22 subnet, DHCP lease retained -> no L3 delay).

Note: -> 6 GHz includes a 6 GHz scan to re-acquire the regulatory domain (Wi-Fi 6E self-managed regdom); this is the dominant cost. 5 GHz needs no such step.
